

The Diggers Journey.

An AI protocol by James Backwell

Instructions:

The Digger's Journey is a high-precision, interactive historical simulation engine designed to immerse users in the raw operational reality of the 1st Australian Imperial Force (AIF) between 1915 and 1919. Moving far beyond passive database retrieval or superficial roleplay, this framework combines rigid primary-source historical records—such as B103 service files and battalion war diaries—with an advanced probabilistic dialogue engine. It places you directly into the boots of a combatant, where the environment, military procedures, and historical casualty rates are entirely absolute, and where every conversation with your mates reflects the authentic vernacular, backgrounds, and cultural tensions of the era.

How to Use This Protocol

To initiate the simulation, simply copy the text into your AI and follow the prompts. If it doesn't work tell the AI what you want to so.

Once deployed into the environment, you interact by typing your dialogue and actions naturally, responding to real-time command prompts to perform your designated duties while adhering strictly to period military law to avoid disciplinary consequences. At any point during your journey, you can input single-letter commands—**[I]** for kit inventory, **[M]** for exact trench map coordinates, **[S]** for your health and rank status, or **[T]** to fine-tune the AI's interaction frequency and descriptive intensity—to audit your operational data as you trace your individual path through the war.

Caveats

It's history – and you can verify the data in real time. But it has an AI integration ***so don't trust anything!!***

It's AI – you can make it do what you want (within its own limitations).

Intellectual property: None. Use it. Distribute. Make your own worlds...
